have addenda bringing the subject up to date, whereas others do not. Six of the articles were written before 1973 and are somewhat outdated.

This volume will be most useful to those with a primary interest in pathology. The surgeon will find it most useful as a reference source providing an overview in specific areas of endocrine pathophysiology.

Samuel A. Wells, Jr., M.D.

Stressed after its immensely popular Manual of Medical Therapeutics, this manual is intended to provide the reader with a readily available guide to the non-operative management of the surgical patient. In its evolution to the third edition, it has been improved and the content expanded without producing a volume too large for the busy doctor's desk. The guidelines for the management of surgical problems are concisely written and are based on sound surgical principles. New sections on acute respiratory insufficiency, nutritional therapy, gynecologic emergencies, and minor surgical techniques have expanded the scope of the manual. The sections on surgical infections and transfusion reactions are excellent and completely up-to-date. The suggested reading list at the end of some sections, while sparse, is an improvement over previous editions.

The editors clearly do not intend for the manual to be employed as a surgical test, and those who use it as such invite educational disaster. As an adjunct to a standard surgical text, it will be found by the student, house officer, or practitioner to be a well-organized, convenient, and economical source of information.

William B. Belzer, M.D.

After an introduction on the history of nutrition this manual is organized into three parts: Part I describes the fundamentals of nutrition with emphasis on concise, but clear, descriptions of the essentials of metabolism. The second part on sources and utilization of energy provides understanding of absorption of nutrients and of various nutritional needs. The third and last part, comprised of thirteen chapters, presents the response to starvation and stress. The chapters on starvation and stress describe metabolic responses to injury, surgical operations, starvation, intestinal fistulas, cancer, and infection. In addition the requirements and techniques for providing optimal nutritional care in surgical patients is outlined precisely. Special problems such as liver disease, renal failure, and the problems unique to infants are also given particular attention. The manual permits a clear understanding of nutrition in surgical patients and provides practical descriptions of recognition and correction of nutritional abnormalities. This book is extremely well organized, clearly written, and readable. This reviewer found the manual to be most interesting. Each chapter presented his material effectively and in such a way that the central theme of the publication was maintained throughout. Carefully chosen pertinent references document each chapter while excellent illustrative material enhances the text.

This manual also includes an effectively organized Appendix providing examples of diets, dietary supplements and dietary requirements. In preparing Manual of Surgical Nutrition the Committee of Pre and Postoperative Care of the American College of Surgeons has provided a great contribution to the surgical profession and thereby to surgical patients. The manual is most highly recommended for all surgeons.

R. Scott Jones, M.D.

Dr. Mayo's book on clinical evaluation effectively fills a major void in trauma medicine. With the increased development of instrumentation and laboratory analysis, the newly trained physician has become less adept in physical diagnosis and its application to trauma medicine. This book deals exclusively in the assessment of patients with various system injuries leaving treatment to other authors. The priorities of care as developed in this textbook are concise, organized and, if applied, will certainly assist in developing better emergency care. The chapters on cardio-thoracic and neurologic injuries present assessment techniques clearly for the non-specialists. Evaluations of chest and head injuries are often poorly done. The chapter on multisystem injuries illustrates a clear approach that will benefit learners at all levels in approaching these patients with serious injuries. The only deficit in the text is the section on physiologic commitments of injury. It was not well enough delineated for those unfamiliar with physiologic consequences of injury and too superficial for those with pre-existing knowledge.
